## **6291.0.55.001 - Labour Force, Australia, Detailed - Electronic Delivery, Jan 2019**

Previous ISSUE Released at 11:30 AM (CANBERRA TIME) 28/02/2019

---

## **Summary**

### **Main Features**

Data from the monthly Labour Force Survey are released in two stages. The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) are part of the second release, and include detailed data not contained in the Labour Force, Australia (cat. no. 6202.0) product set, which is released one week earlier.

The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) is released monthly. Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) includes data only collected in February, May, August and November (including industry and occupation).

Since these products are based on the same data as the Labour Force, Australia (cat. no. 6202.0) publication, the 6202.0 Labour Force, Australia Explanatory Notes are relevant to both releases.

### **NEW LABOUR FORCE SURVEY SAMPLE**

As previously highlighted, the ABS is currently phasing in a new sample design. This began with the incoming rotation group in July 2018 and will continue through to February 2019. An information paper titled Information Paper: Labour Force Survey Sample Design, Jul 2018 (cat. no. 6269.0) was released on 30 July 2018 with detailed information on the new sample. As with each regular sample design, the impacts on the data are expected to be minimal and the ABS will monitor the quality of the estimates over the period the sample is phased in.

## **Insights from the Original Data**

### **INSIGHTS FROM THE ORIGINAL DATA**

#### **SAMPLE COMPOSITION**

The Labour Force Survey sample can be thought of as comprising eight sub-samples (or rotation groups), with each sub-sample remaining in the survey for eight months, and one rotation group "rotating out" each month and being replaced by a new group "rotating in". This sample rotation is important in ensuring that seven-eighths of the sample are common from one month to the next, to ensure that changes in the estimates reflect real changes in the labour market, rather than the sample. In addition, the replacement sample is generally selected from the same geographic areas as the outgoing one, as part of a representative sampling approach.

When considering movements in the original estimates, it is possible to decompose the sample into three components:

- the matched common sample (survey respondents who responded in both December and January);
- the unmatched common sample (survey respondents who responded in January but who did not respond in December, or vice versa); and
- the incoming rotation group (survey respondents who replaced respondents who rotated out in December).

The detailed decomposition of each of these movements is included in the data cube 'Insights From the Original Data'.

In considering the three components of the sample, it is important to remember that the matched common sample describes the change observed for the same respondents in December and November, while the other two components reflect differences between the aggregate labour force status of different groups of people.

While the rotation groups are designed to be representative of the population, the outgoing and incoming rotation groups will almost always have somewhat different characteristics, as a result of the groups representing a sample of different households and people. The design of the survey, including the weighting and estimation processes, ensures that these differences are generally relatively minor and seeks to ensure that differences in characteristics of rotation groups do not affect the representativeness of the survey and its estimates. Monthly estimates are always designed to be representative of their respective months, regardless of the relative contribution of the three components of the sample.

## **INCOMING ROTATION GROUP**

In original terms, the incoming rotation group in January 2019 had a lower employment to population ratio (63.6% in December, down to 61.0% in January 2019) than the group it replaced, and was lower than the ratio for the entire sample (61.7%).

The full-time employment to population ratio of the incoming rotation group was lower than the group it replaced (43.6% in December, down to 42.6% in January 2019), and was lower than the ratio for the entire sample (42.8%).

The unemployment rate of the incoming rotation group was 1.0 pts higher than the whole sample (6.4%, compared to 5.4%), and it replaced a group with a lower rate (4.1%). Its participation rate was below that of the sample as a whole (65.2%, compared to 65.3%), and below the group it replaced (66.3% in December 2018).

## **OUTGOING ROTATION GROUP**

In looking ahead to the February 2019 estimates, the outgoing rotation group in January 2019, which will be replaced by a new incoming rotation group in February 2019, has a higher employment to population ratio (62.8% in January 2019) than the sample as a whole (61.7%) in original terms. The full-time employment to population ratio (43.8%) is higher than the ratio for the entire sample (42.8%).

The unemployment rate for the outgoing rotation group in January 2019 is lower than the whole sample (4.5%, compared to 5.4%). The participation rate for the outgoing rotation group in January 2019 is higher than the sample as a whole (65.7%, compared to 65.3%).

## **THE IMPORTANCE OF TREND DATA**

As the gross flows and rotation group data are presented in original terms they are not directly comparable to the seasonally adjusted and trend data discussed elsewhere in the commentary, and are included to provide additional information for the original data. Since the original data are unadjusted, they have a considerable level of inherent sampling variability, which is specifically adjusted for in the trend series. The trend data provide the best measure of the underlying behaviour of the labour market and are the focus of the commentary in this publication.

## **ROTATION GROUP ANALYSIS FOR STATES AND TERRITORIES**

In recent months, a number of users of this information have asked whether the ABS also undertakes state and territory rotation group analysis, given the above summaries generally focus analysis for the entire sample and the related national estimates.

In addition to analysis across the entire sample, the ABS also undertakes similar analysis for the responding sample in each state and territory each month, and highlights where there is a notable change for users to be aware of. For example, in the release of July 2018 data, on 16 August 2018, the ABS noted that "the rotation group effects in July 2018 were most pronounced in Queensland, Tasmania and the ACT."

As for its reporting for the entire sample, where the ABS has not highlighted a notable incoming rotation group effect, any larger changes should therefore be considered to reflect a broader change across the sample.

## **Article Archive**

This section provides an archive of articles and analysis published in Labour Force, Australia (cat. no. 6202.0) and Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003), promoting the effective use of labour force statistics. Articles are sorted by publication month.

Articles on labour related topics are also available in Australian Labour Market Statistics (cat. no. 6105.0) and Australian Social Trends (cat. no. 4102.0).

## **About this Release**

A range of Labour Force related Excel spreadsheets and Excel pivot tables. The monthly spreadsheets contain broad level data covering all the major items of the Labour Force Survey in time series format, including seasonally adjusted and trend estimates. The monthly pivot tables contain more detailed and cross classified original data than the spreadsheets.

## **Explanatory Notes**

### **Explanatory Notes**

Data from the monthly Labour Force Survey are released in two stages. The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) are part of the second release, and include detailed data not contained in the Labour Force, Australia (cat. no. 6202.0) product set, which is released one week earlier.

The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) is released monthly. Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) includes data only collected in February, May, August and November (including industry and occupation).

Since these products are based on the same data as the Labour Force, Australia (cat. no. 6202.0) publication, the 6202.0 Labour Force, Australia Explanatory Notes are relevant to both releases.

## **Time Series Spreadsheet (I-Note) - Time Series Spreadsheet**

The median data that were previously released in SuperTable data cubes have been converted to time series spreadsheets 14c, 14d, 14e and 16c, to reduce the complexity of pivot table products.

## **Time Series Spreadsheet (I-Note) - Time Series Spreadsheet**

The median data that were previously released in SuperTable data cubes have been converted to time series spreadsheets 14c, 14d, 14e and 16c, to reduce the complexity of pivot table products.

## **Time Series Spreadsheet (I-Note) - Time Series Spreadsheet**

The median data that were previously released in SuperTable data cubes have been converted to time series spreadsheets 14c, 14d, 14e and 16c, to reduce the complexity of pivot table products.

## **Time Series Spreadsheet (I-Note) - Time Series Spreadsheet**

For advice on reporting data from this product, please refer to: Advice on reporting regional labour force data.

Due to the flooding in Queensland in January 2011, the Relative Standard Errors (RSE) for January 2011 vary across labour market regions and are higher than normal in some. The RSEs for the Darling Downs-South West and Ipswich City labour market regions are approximately 50% higher, while the RSEs for the Brisbane City Inner Ring labour market region increased by approximately 25%. The Brisbane City Outer Ring, West Moreton and Mackay-Fitzroy-Central West labour market regions have RSEs approximately 10% higher. All other labour market regions have minimal differences. From February 2011, the data returns to normal. Refer to the article Impact of the floods on the Labour Force Survey in the January 2011 issue of Labour Force, Australia, (cat. no. 6202.0) for more information.

The labour force sample selected after the 2011 Census was phased-in over four months from May to August 2013. See the article titled "New Labour Force Sample Design" in the May 2013 issue of Labour Force, Australia (cat. no. 6202.0) for more information. During phase in of the new sample, standard errors associated with key labour force data are expected to increase by approximately 10% at a national level, however increased standard errors and variability in the estimates may be more evident in detailed regional data during this time.

## **Time Series Spreadsheet (I-Note) - Time Series Spreadsheet**

For advice on reporting data from this product, please refer to: Advice on reporting regional labour force data.

Due to the flooding in Queensland in January 2011, the Relative Standard Errors (RSE) for January 2011 vary across labour market regions and are higher than normal in some. The RSEs for the Darling Downs-South West and Ipswich City labour market regions are approximately 50% higher, while the RSEs for the Brisbane City Inner Ring labour market region increased by approximately 25%. The Brisbane City Outer Ring, West Moreton and Mackay-Fitzroy-Central West labour market regions have RSEs approximately 10% higher. All other labour market regions have minimal differences. From February 2011, the data returns to normal. Refer to the article Impact of the floods on the Labour Force Survey in the January 2011 issue of Labour Force, Australia, (cat. no. 6202.0) for more information.

The labour force sample selected after the 2011 Census was phased-in over four months from May to August 2013. ## **Time Series Spreadsheet (I-Note) - Time Series Spreadsheet**

The median data that were previously released in SuperTable data cubes have been converted to timeseries spreadsheets 14c, 14d, 14e and 16c, to reduce the complexity of pivot table products.

For advice on reporting data from this product, please refer to: Advice on reporting regional labour force data.

Due to the flooding in Queensland in January 2011, the Relative Standard Errors (RSE) for January 2011 vary across labour market regions and are higher than normal in some. The labour force sample selected after the 2011 Census was phased-in over four months from May to August 2013. See the article titled "New Labour Force Sample Design" in the May 2013 issue of Labour Force, Australia (cat. no. 6202.0) for more information. During phase in of the new sample, standard errors associated with key labour force data are expected to increase by approximately 10% at a national level, however increased standard errors and variability in the estimates may be more evident in detailed regional data during this time.

## **Standard Errors**

Estimates from the Labour Force Survey (LFS) are based on information collected from people in a sample of dwellings, rather than the entire population. Hence the estimates produced may differ from those that would have been produced if the entire population had been included in the survey. The most common measure of the likely difference (or 'sampling error') is the standard error (SE).

The ABS considers that estimates with a relative standard error of 25% or more may be subject to sampling variability too high for most practical purposes.

To indicate those cells in spreadsheets with a relative standard error of 25% or more, annotations have been applied prior to dissemination.

In addition, the tables below have been supplied to show estimates at which the relative standard error is 25%. Estimates of the size indicated in the tables, or smaller, are considered to be subject to sampling variability too high for most practical purposes.

Due to the January 2011 flooding in Queensland the relative standard errors for January 2011 will be higher than normal in some regions, therefore for Queensland the estimates at which the relative standard error is 25% will be higher than they appear in the tables below. However from February, the data returns to normal.

The new labour force sample was phased-in over four months from May to August 2013. During phase in of the new sample, standard errors associated with key labour force data were expected to increase by approximately 10% at a national level, however increased standard errors and

variability in the estimates may be more evident in detailed regional data during this time.

Additional information on how standard errors for LFS estimates are produced is available in Labour Force Survey Standard Errors, Data Cube (cat. no. 6298.0.55.001).

# Quality Declaration - Summary

## QUALITY DECLARATION - SUMMARY

### INSTITUTIONAL ENVIRONMENT

Labour Force statistics are compiled from the Labour Force Survey which is conducted each month throughout Australia as part of the Australian Bureau of Statistics (ABS) household survey program. For information on the institutional environment of the Australian Bureau of Statistics (ABS), including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.

### RELEVANCE

The Labour Force Survey provides monthly information about the labour market activity of Australia's resident civilian population aged 15 years and over. The Labour Force Survey is designed to primarily provide estimates of employment and unemployment for the whole of Australia and, secondarily, for each state and territory.

### TIMELINESS

The Labour Force Survey enumeration begins on the Sunday between the 5th and 11th of the month, except for the Christmas and New Year holiday period. In December enumeration starts between the 3rd and 9th (4 weeks after November enumeration begins). In January enumeration starts between the 7th and 13th (5 weeks after December enumeration begins).

Key estimates from the Labour Force Survey are published in two stages. The first, Labour Force, Australia (cat. no. 6202.0), is released 39 days after the commencement of enumeration for the month, with the exception of estimates for December which are published 46 days after the commencement of enumeration.

The second stage includes detailed data that were not part of the first stage and are published in Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003). The second stage is released 7 days after the first stage.

### ACCURACY

The Labour Force Survey is based on a sample of private dwellings (approximately 26,000 houses, flats etc) and non-private dwellings, such as hotels and motels. The sample covers about 0.32% of the Australian civilian population aged 15 years or over. The Labour Force Survey is designed primarily to provide estimates of key labour force statistics for the whole of Australia and, secondarily, for each state and territory.

Two types of error are possible in an estimate based on a sample survey: non-sampling error and sampling error.

Non-sampling error arises from inaccuracies in collecting, recording and processing the data. Every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures. Non-sampling error also arises because information cannot be obtained from all persons selected in the survey. The Australian Labour Force Survey receives a higher level of co-operation from individuals in selected dwellings compared to other countries, with the average response rate over the past 3

years being 92.5 per cent, and the average rate over the past year being 92.0 per cent (to the nearest quarter of a per cent, in rounded terms). See Glossary for definition of response rate.

Sampling error occurs because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all dwellings in the survey is given by the standard error. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

Standard errors of key estimates and movements since the previous month are available in Labour Force, Australia (cat. no. 6202.0). The standard error of other estimates and movements may be calculated by using the spreadsheet contained in Labour Force Survey Standard Errors, Data Cube (cat. no. 6298.0.55.001).

## **COHERENCE**

The ABS has been conducting the Labour Force Survey each month since February 1978. While seeking to provide a high degree of consistency and comparability over time by minimising changes to the survey, sound survey practice requires careful and continuing maintenance and development to maintain the integrity of the data and the efficiency of the collection.

The changes which have been made to the Labour Force Survey have included changes in sampling methods, estimation methods, concepts, data item definitions, classifications, and time series analysis techniques. In introducing these changes the ABS has generally revised previous estimates to ensure consistency and coherence with current estimates. For a full list of changes made to the Labour Force Survey see Chapter 20 in Labour Statistics: Concepts, Sources and Methods (cat. no. 6102.0.55.001).

## **INTERPRETABILITY**

The key estimates from the Labour Force Survey are available as original, seasonally adjusted and trend series. Seasonal adjustment is a means of removing the effects of normal seasonal variation from the series so other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove the irregular influences which may be present and therefore month-to-month movements may not be reliable indicators of underlying behaviour. To assist in interpreting the underlying behaviour, the ABS produces the trend series by smoothing the seasonally adjusted series to reduce the impact of the irregular component. For further information, see A Guide to Interpreting Time Series - Monitoring Trends (cat. no. 1349.0).

Further information on the terminology and other technical aspects associated with statistics from the Labour Force Survey can be found in the publication Labour Force, Australia (cat. no. 6202.0), which contains detailed Explanatory Notes, Standard Error information and a Glossary.

## **ACCESSIBILITY**
